De Simone, G., Quattrocchi, A., Mancini, B., di Masi, A., Nervi, C., & Ascenzi, P.
(2022) Thalasseмии: From gene to therapy. *Molecular Aspects of Medicine*, 84, 101028.

Thalasseмии are hereditary disorders characterized by:

- Microcytic and hypochromic anemia**
- Hemoglobinopathy due to deficiency of globin chains belonging to either the α - or β -cluster**

The presentation and severity of thalassemia depends on the number of defective hemoglobin chains

α , β , γ , δ , $\delta\beta$, $\epsilon\gamma\delta\beta$

Thalassemia: From Early Milestones to the Present and Future

1889 First report of the homozygous clinical traits of thalassemia

1925 Description of the clinical traits of thalassemia

1925 Increased osmotic resistance of erythrocytes

1932 The term “Thalassemia” was coined recognizing Mediterranean ethnics

(θάλασσα, thàlassa, «sea», and αίμα, àima, «blood»)

1938 Thalassemia is recognized as a genetic disease

1944 First blood transfusion for clinical treatment

1948 Thalassemia is determined to be caused by an abnormal hemoglobin

1964 The thalassemia mutation is found to protect against malaria

1976 Prenatal diagnosis for thalassemia becomes available

1977 Iron chelation improve patient survival

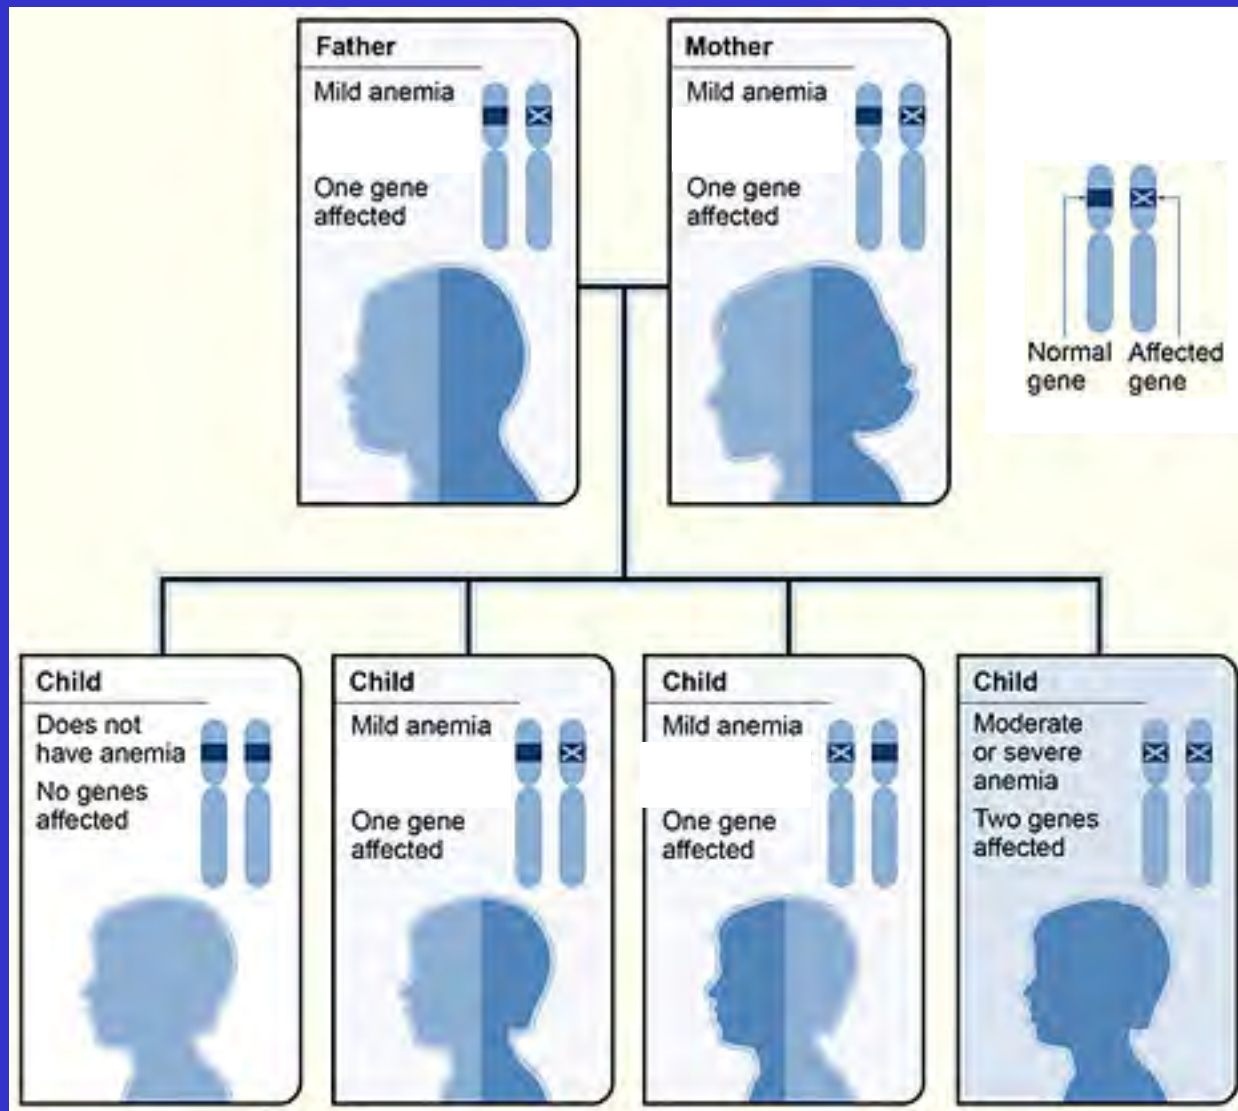

1982 Bone marrow transplantation is first used to cure thalassemia

1985 Pharmacologic HbF induction: use of butyrate and hydroxyurea in clinical trials

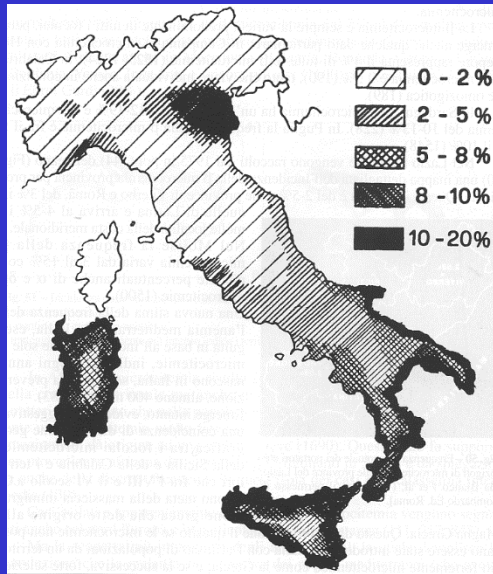

2005 Gene therapy clinical trials with improved vectors in patients with severe disorder

2010-2022 Encouraging results from clinical trials of the reactivation of fetal hemoglobin by lentiviral vectors or genome editing

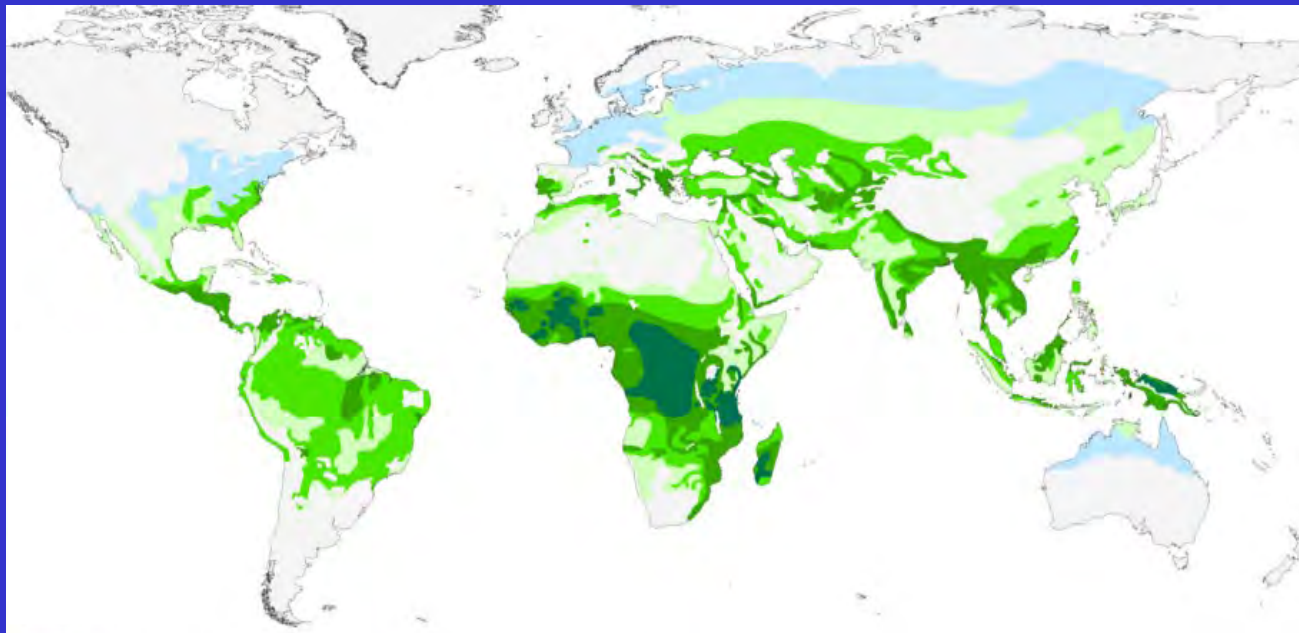

Mendelian inheritance of thalassemia

Geographical distribution

Thalassemia
1.7% of the
global population

Malaria
3.6% of the
global population

Thalassemia detection in human ancient bones

Proc. Natl. Acad. Sci. USA
Vol. 82, pp. 7170-7172, November 1985
Biochemistry

Immunological detection of hemoglobin in bones of ancient Roman times and of Iron and Eneolithic Ages

(heme proteins/paleopathology/skeletal remains)

A. ASCENZI*, M. BRUNORI†, G. CITRO‡, AND R. ZITO‡

*Department of Human Biopathology, University of Rome "La Sapienza," †Institute of Chemistry, Faculty of Medicine, University of Rome "La Sapienza," and ‡Regina Elena Institute for Cancer Research, Rome, Italy

HISTORY OF MEDICINE

In what ways can human skeletal remains be used to understand health and disease from the past?

Neil H Metcalfe

Hemoglobin: the main actor

Globin gene clusters

α -globin gene cluster - *ch16*

β -globin gene cluster - *ch11*

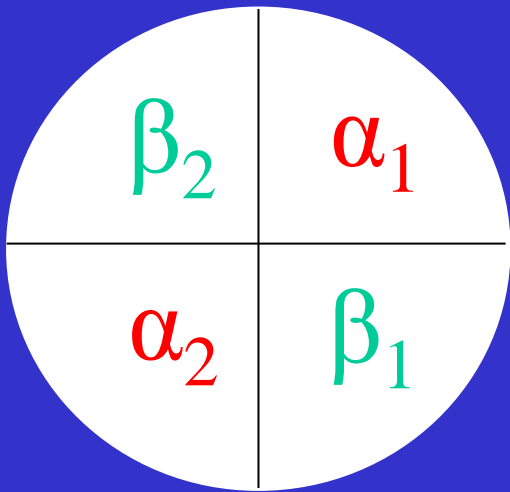

Hemoglobin chains expression during the development of the human hematopoietic system

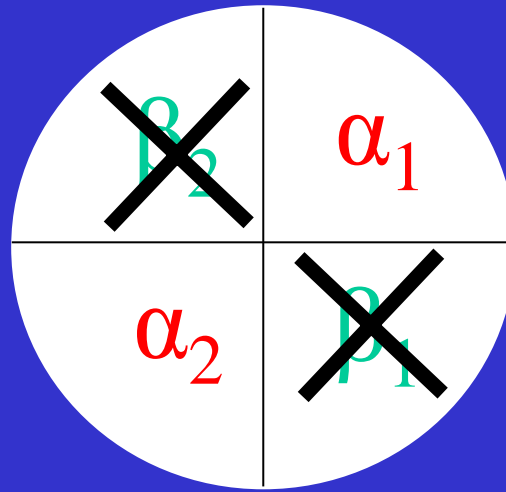

From: Istologia di Monesi, VII Ed., Piccin, Padova, 2018

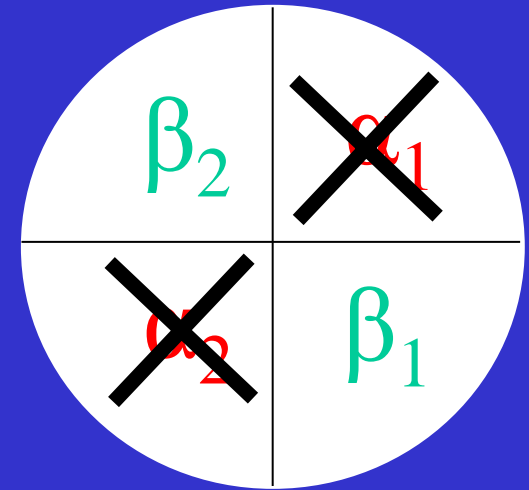

Molecular bases of α - and β -thalassemia

**Normal Hb
HbA and HbA2**

β -Thalassemia

α -Thalassemia

Thalassemic globins belonging to the α -cluster (ζ , μ , ϑ , α)

Subunit contacts of thalassemic globins belonging to the β -cluster (ϵ , γ , δ , β)

$\epsilon_1\epsilon_2$ interface

$\beta_1\beta_2$ interface

$\gamma_1\gamma_2$ interface

$\delta_1\delta_2$ interface

Thalassemic traits

Anemia, beginning early in life

Ineffective erythropoiesis

Extramedullary hematopoiesis

Splenomegaly

Bone deformities

Characteristic *facies* (known as *chipmunk face*)

Red cells with increased resistance to osmotic lysis

Familial incidence

Treatment of thalassemia

Blood transfusion and iron chelation

Pharmacological reactivation of human fetal hemoglobin

Hematopoietic stem cell transplantation

Gene therapy

Gene editing

Blood transfusion and iron chelation

Blood transfusion maintains adequate Hb levels and reduces hypoxia and its consequences:

Massive expansion of erythroid precursors in hematopoietic tissues

Bone deformities

Hepatosplenomegaly → splenectomy

The target Hb levels are 9-12 g/dl

The iron chelation therapy prevents hemosiderosis in both transfused and non-transfused patients

The target ferritin levels are < 1000 ng/ml

Iron chelators: deferoxamine, deferiprone, deferasirox

Pharmacological reactivation of human fetal hemoglobin

In β - δ -, $\delta\beta$ -, thalassemia, the excess of α -chains can be neutralized by γ -chains

Drugs raising HbF expression levels

5-azacytidine → demethylating agent

Butyrate → histone deacetylation inhibitor

Hydroxyurea → ribonucleotide reductase inhibitor
→ soluble guanylate cyclase activator

Hematopoietic stem cell transplantation

Life-time therapy

20 years of thalassemia-free survival is 73%

Production of normal Hb

Defective stem cells are destroyed

Heterologous transplantation

Immunologically matched donor (<20% of the patients)

Immunosuppression

Thomas ED, et al. (1982) Marrow transplantation for thalassaemia. *Lancet* 31, 227–229.
Lucarelli G, et al. (1987) Marrow transplantation in patients with advanced thalassemia.
N Engl J Med. 316, 1050-5.

Gene therapy and genome editing approaches for transfusion-dependent β -thalassemia

Hematopoietic stem cells derived from the patient are genetically modified and re-infused into fully or partially myeloablated patient's bone marrow

Normal differentiation of erythropoietic cells

Life-time therapy

Possible drawbacks: tumor formation, viral toxicity, and germ-line transfer

As a whole and perspectives

Prenatal diagnosis

Therapy

Blood transfusion and iron chelation

Bone marrow transplantation

Pharmacologic HbF induction

Gene therapy and genome editing

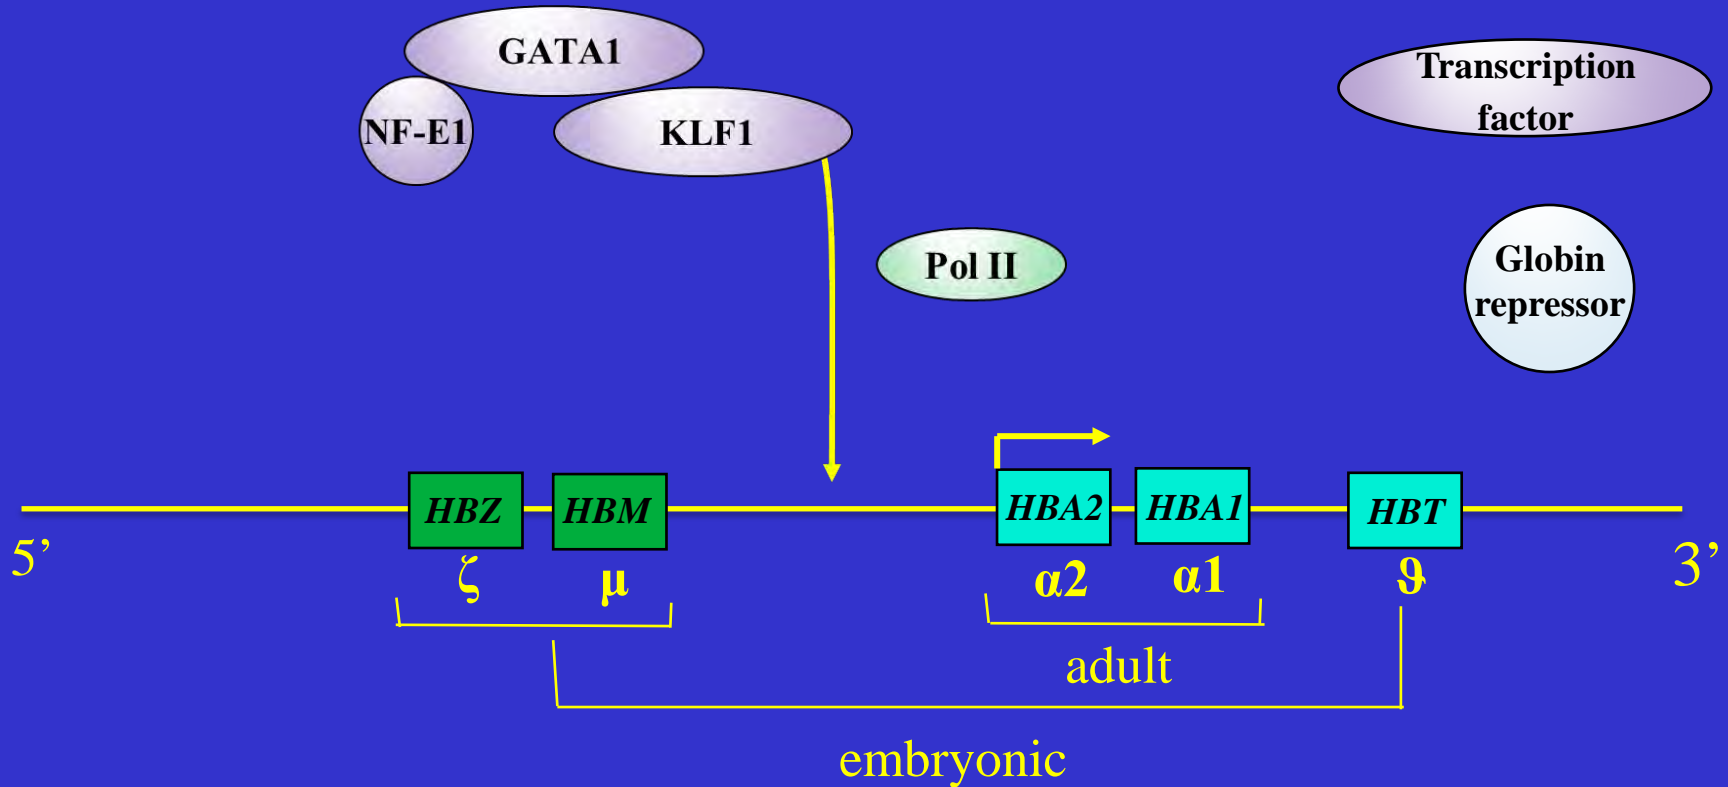

Thalassemia

The Neverending Story
